

To get visualization to work on Windows, you need to include the mingw folder on the search PATH of the system.

Go to the spyglass and type “control panel”, and when it pops open type “environment variables” in the search box. Then click on “Edit the system environment variables”:

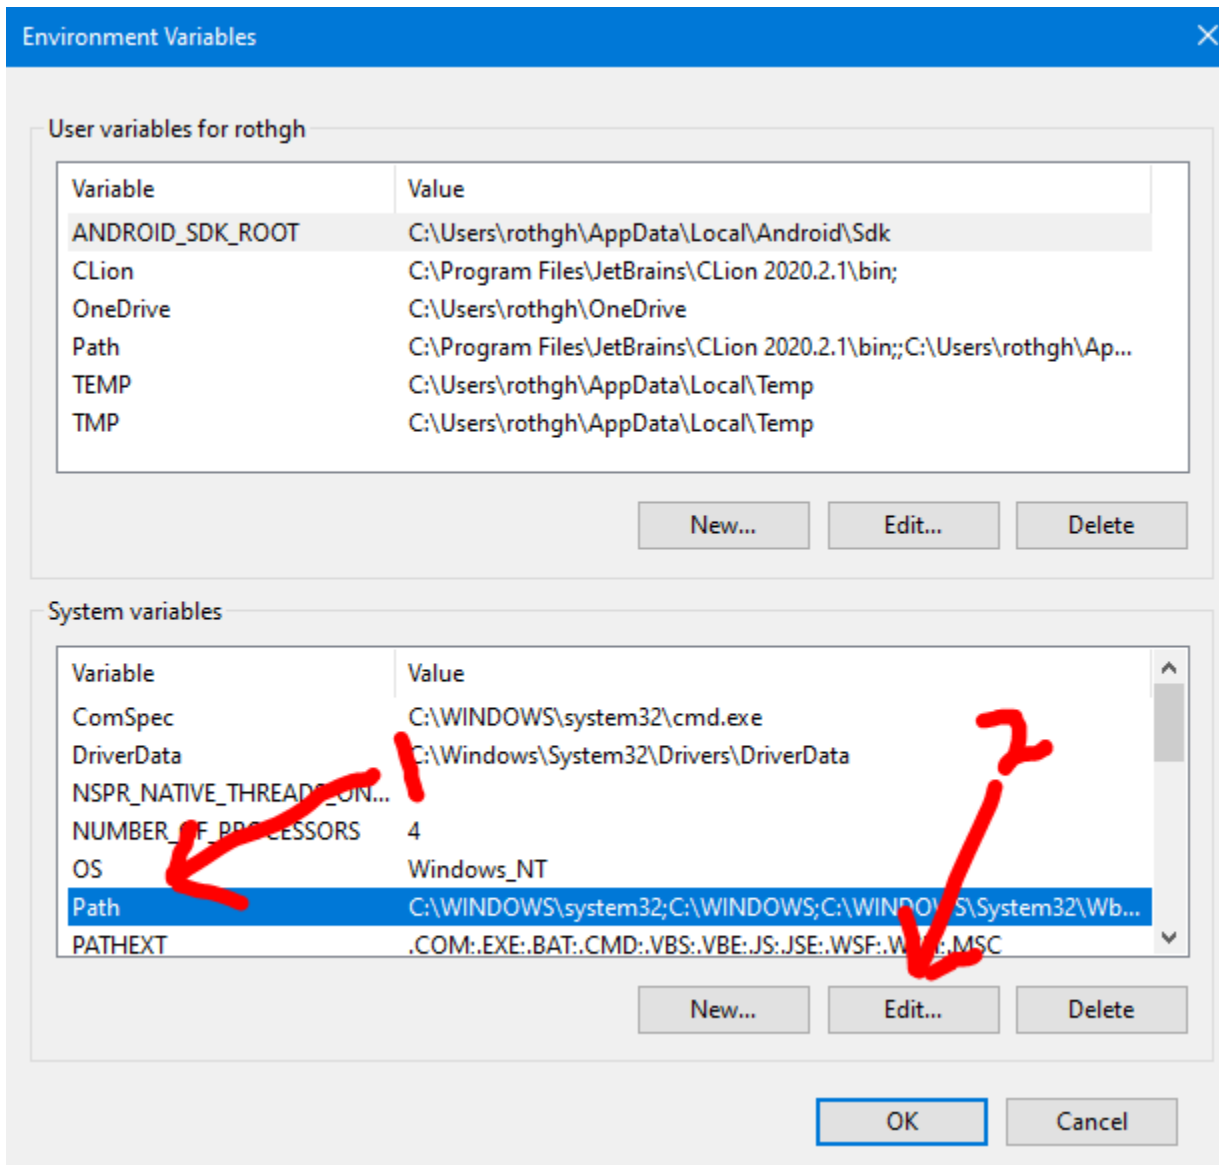

Once you are there, you will want to do the following:

1. Click on Edit Environment Variables

2. Under “System variables”, select the PATH variable and click on Edit.

3. Click on new and add the path to those DLL's in there (mine are located at C:\msys64\mingw64\bin\). Then click OK.

Open a new command prompt window and try executing the project7 program again. This time it should find all the DLLs it needs.

If that doesn't work, then the next step would be to locate those DLL's on your system and determine where they are and put a copy of them in the mingw bin directory.
